Workload Characterization Techniques

Raj Jain
Washington University in Saint Louis
Saint Louis, MO 63130
Jain@cse.wustl.edu

These slides are available on-line at:
http://www.cse.wustl.edu/~jain/cse567-08/
Overview

- Terminology
- Components and Parameter Selection
- Workload Characterization Techniques: Averaging, Single Parameter Histograms, Multi-parameter Histograms, Principal Component Analysis, Markov Models, Clustering
- Clustering Method: Minimum Spanning Tree, Nearest Centroid
- Problems with Clustering
Terminology

- User = Entity that makes the service request

- Workload components:
  - Applications
  - Sites
  - User Sessions

- Workload parameters or Workload features: Measured quantities, service requests, or resource demands. For example: transaction types, instructions, packet sizes, source-destinations of a packet, and page reference pattern.
Components and Parameter Selection

- The workload component should be at the SUT interface.
- Each component should represent as homogeneous a group as possible. Combining very different users into a site workload may not be meaningful.
- Domain of the control affects the component: Example: mail system designer are more interested in determining a typical mail session than a typical user session.
- Do not use parameters that depend upon the system, e.g., the elapsed time, CPU time.
Components (Cont)

- Characteristics of service requests:
  - Arrival Time
  - Type of request or the resource demanded
  - Duration of the request
  - Quantity of the resource demanded, for example, pages of memory

- Exclude those parameters that have little impact.
Workload Characterization Techniques

1. Averaging
2. Single-Parameter Histograms
3. Multi-parameter Histograms
4. Principal Component Analysis
5. Markov Models
6. Clustering
Averaging

- **Mean**
  \[ \bar{x} = \frac{1}{n} \sum_{i=1}^{n} x_i \]

- **Standard deviation:**
  \[ s^2 = \frac{1}{n-1} \sum_{i=1}^{n} (x_i - \bar{x})^2 \]

- **Coefficient Of Variation:**
  \[ s / \bar{x} \]

- **Mode (for categorical variables):** Most frequent value

- **Median:** 50-percentile
### Case Study: Program Usage in Educational Environments

- Reasonable variation
Single Parameter Histograms

- $n$ buckets $\times m$ parameters $\times k$ components values.
- Use only if the variance is high.
- Ignores correlation among parameters.
Multi-parameter Histograms

- Difficult to plot joint histograms for more than two parameters.
Principal Component Analysis

- **Key Idea**: Use a weighted sum of parameters to classify the components.
- Let $x_{ij}$ denote the $i$th parameter for $j$th component.
  \[ y_j = \sum_{i=1}^{n} w_i x_{ij} \]
- Principal component analysis assigns weights $w_i$'s such that $y_j$'s provide the maximum discrimination among the components.
- The quantity $y_j$ is called the principal factor.
- The factors are ordered. First factor explains the highest percentage of the variance.
Principal Component Analysis (Cont)

- Statistically:
  - The y's are linear combinations of x's:
    \[ y_i = \sum_{j=1}^{n} a_{ij} x_j \]
    Here, \( a_{ij} \) is called the loading of variable \( x_j \) on factor \( y_i \).
  
  - The y's form an orthogonal set, that is, their inner product is zero:
    \[ <y_i, y_j> = \sum_k a_{ik}a_{kj} = 0 \]
    This is equivalent to stating that \( y_i \)'s are uncorrelated to each other.

  - The y's form an ordered set such that \( y_1 \) explains the highest percentage of the variance in resource demands.
Finding Principal Factors

- Find the correlation matrix.
- Find the eigen values of the matrix and sort them in the order of decreasing magnitude.
- Find corresponding eigen vectors. These give the required loadings.
### Principal Component Example

| Sum $x$  | 96336    | 0.000                 | 0.000  | 0.000  |
| Sum $x^2$| 567119488| 17.000                | 32.565 | 1.435  |
| Mean     | 5352.0   | 0.000                 | 0.000  | 0.000  |
| Std. Dev.| 1741.0   | 1.000                 | 1.384  | 0.290  |
Principal Component Example

- Compute the mean and standard deviations of the variables:

\[
\bar{x}_s = \frac{1}{n} \sum_{i=1}^{n} x_{si} = \frac{96336}{18} = 5352.0
\]

\[
\bar{x}_r = \frac{1}{n} \sum_{i=1}^{n} x_{ri} = \frac{88009}{18} = 4889.4
\]
Similarly:

\[
\sigma^2_{x_s} = \frac{1}{n-1} \sum_{i=1}^{n} (x_{si} - \bar{x}_s)^2
\]

\[
= \frac{1}{n-1} \left[ \left( \sum_{i=1}^{n} x_{si}^2 \right) - n \bar{x}_s^2 \right]
\]

\[
= \frac{567119488 - 18 \times 5353^2}{17} = 1741.0^2
\]

Similarly:

\[
\sigma^2_{x_r} = \frac{462661024 - 18 \times 4889.4^2}{17} = 1379.5^2
\]
Normalize the variables to zero mean and unit standard deviation. The normalized values $x'_s$ and $x'_r$ are given by:

$$x'_s = \frac{x_s - \bar{x}_s}{s_{x_s}} = \frac{x_s - 5352}{1741}$$

$$x'_r = \frac{x_r - \bar{x}_r}{s_{x_r}} = \frac{x_r - 4889}{1380}$$
Compute the correlation among the variables:

\[
R_{x_s,x_r} = \frac{1}{n} \sum_{i=1}^{n} \frac{(x_{si} - \bar{x}_s)(x_{ri} - \bar{x}_r)}{s_{x_s} s_{x_r}} = 0.916
\]

Prepare the correlation matrix:

\[
C = \begin{bmatrix}
1.000 & 0.916 \\
0.916 & 1.000
\end{bmatrix}
\]
Compute the eigen values of the correlation matrix: By solving the characteristic equation:

\[
|\lambda I - C| = \begin{vmatrix}
\lambda - 1 & -0.916 \\
-0.916 & \lambda - 1 \\
\end{vmatrix} = 0
\]

\[
(\lambda - 1)^2 - 0.916^2 = 0
\]

The eigen values are 1.916 and 0.084.
Compute the eigen vectors of the correlation matrix. The eigen vectors $q_1$ corresponding to $\lambda_1=1.916$ are defined by the following relationship:

$$\{ C \} \{ q \}_1 = \lambda_1 \{ q \}_1$$

or:

$$\begin{bmatrix} 1.000 & 0.916 \\ 0.916 & 1.000 \end{bmatrix} \times \begin{bmatrix} q_{11} \\ q_{21} \end{bmatrix} = 1.916 \begin{bmatrix} q_{11} \\ q_{21} \end{bmatrix}$$

or:

$$q_{11}=q_{21}$$
Principal Component (Cont)

- Restricting the length of the eigen vectors to one:

\[
q_1 = \begin{bmatrix}
\frac{1}{\sqrt{2}} \\
\frac{1}{\sqrt{2}}
\end{bmatrix} \quad q_2 = \begin{bmatrix}
\frac{1}{\sqrt{2}} \\
-\frac{1}{\sqrt{2}}
\end{bmatrix}
\]

- Obtain principal factors by multiplying the eigen vectors by the normalized vectors:

\[
\begin{bmatrix}
y_1 \\
y_2
\end{bmatrix} = \begin{bmatrix}
\frac{1}{\sqrt{2}} & -\frac{1}{\sqrt{2}} \\
\frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}}
\end{bmatrix} \begin{bmatrix}
x_s - 5352 \\
x_r - 1741 \\
x - 4889 \\
x - 1380
\end{bmatrix}
\]

- Compute the values of the principal factors.
- Compute the sum and sum of squares of the principal factors.
Principal Component (Cont)

- The sum must be zero.
- The sum of squares give the percentage of variation explained.
The first factor explains $\frac{32.565}{(32.565+1.435)}$ or 95.7% of the variation.

The second factor explains only 4.3% of the variation and can, thus, be ignored.
Markov Models

- Markov
  \[ \Rightarrow \text{the next request depends only on the last request} \]
- Described by a transition matrix:

<table>
<thead>
<tr>
<th>From/To</th>
<th>CPU</th>
<th>Disk</th>
<th>Terminal</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU</td>
<td>0.6</td>
<td>0.3</td>
<td>0.1</td>
</tr>
<tr>
<td>Disk</td>
<td>0.9</td>
<td>0</td>
<td>0.1</td>
</tr>
<tr>
<td>Terminal</td>
<td>1</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

- Transition matrices can be used also for application transitions. E.g., \( \text{P(Link|Compile)} \)
- Used to specify page-reference locality.
  \[ \text{P(Reference module } i \mid \text{Referenced module } j) \]
Transition Probability

- Given the same relative frequency of requests of different types, it is possible to realize the frequency with several different transition matrices.
- If order is important, measure the transition probabilities directly on the real system.
- Example: Two packet sizes: Small (80%), Large (20%)
  - An average of four small packets are followed by an average of one big packet, e.g., sssbssssssbssss.

<table>
<thead>
<tr>
<th>Current Packet</th>
<th>Next packet</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Small</td>
<td>Large</td>
<td></td>
</tr>
<tr>
<td>Small</td>
<td>0.75</td>
<td>0.25</td>
<td></td>
</tr>
<tr>
<td>Large</td>
<td>1</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>
Transition Probability (Cont)

- Eight small packets followed by two big packets.

<table>
<thead>
<tr>
<th>Current Packet</th>
<th>Next packet</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Small</td>
</tr>
<tr>
<td>Small</td>
<td>0.875</td>
</tr>
<tr>
<td>Large</td>
<td>0.5</td>
</tr>
</tbody>
</table>

- Generate a random number $x$.
  
  $x \leq 0.8 \Rightarrow$ generate a small packet;
  otherwise generate a large packet.
Clustering

Diagram showing clusters in a scatter plot with axes labeled "Disk I/O's" and "CPU time."
Clustering Steps

1. Take a sample, that is, a subset of workload components.
2. Select workload parameters.
3. Select a distance measure.
4. Remove outliers.
5. Scale all observations.
6. Perform clustering.
7. Interpret results.
8. Change parameters, or number of clusters, and repeat steps 3-7.
9. Select representative components from each cluster.
1. Sampling

- In one study, 2% of the population was chosen for analysis; later 99% of the population could be assigned to the clusters obtained.
- Random selection
- Select top consumers of a resource.
2. Parameter Selection

- Criteria:
  - Impact on performance
  - Variance
- Method: Redo clustering with one less parameter
- Principal component analysis: Identify parameters with the highest variance.
3. Transformation

- If the distribution is highly skewed, consider a function of the parameter, e.g., log of CPU time
4. Outliers

- Outliers = data points with extreme parameter values
- Affect normalization
- Can exclude only if they do not consume a significant portion of the system resources. Example, backup.
5. Data Scaling

1. Normalize to Zero Mean and Unit Variance:

\[ x'_{ik} = \frac{x_{ik} - \bar{x}_k}{s_k} \]

2. Weights:

\[ x_{ik}' = w_k x_{ik} \]

\[ w_k \propto \text{relative importance or } w_k = 1/s_k \]

3. Range Normalization:

\[ x'_{ik} = \frac{x_{ik} - x_{min,k}}{x_{max,k} - x_{min,k}} \]

Affected by outliers.
Data Scaling (Cont)

- Percentile Normalization:

\[ x_{ik}' = \frac{x_{ik} - x_{2.5,k}}{x_{97.5,k} - x_{2.5,k}} \]
Distance Metric

1. Euclidean Distance: Given \{x_{i1}, x_{i2}, \ldots, x_{in}\} and \{x_{j1}, x_{j2}, \ldots, x_{jn}\}

\[ d = \left\{ \sum_{k=1}^{n} (x_{ik} - x_{jk})^2 \right\}^{0.5} \]

2. Weighted-Euclidean Distance:

\[ d = \sum_{k=1}^{n} \left\{ a_k (x_{ik} - x_{jk})^2 \right\}^{0.5} \]

Here \( a_k, k=1,2,\ldots,n \) are suitably chosen weights for the \( n \) parameters.

3. Chi-Square Distance:

\[ d = \sum_{k=1}^{n} \left\{ \frac{(x_{ik} - x_{jk})^2}{x_{ik}} \right\} \]
Distance Metric (Cont)

- The Euclidean distance is the most commonly used distance metric.

- The weighted Euclidean is used if the parameters have not been scaled or if the parameters have significantly different levels of importance.

- Use Chi-Square distance only if $x_k$'s are close to each other. Parameters with low values of $x_k$ get higher weights.
Clustering Techniques

- Goal: Partition into groups so the members of a group are as similar as possible and different groups are as dissimilar as possible.
- Statistically, the intragroup variance should be as small as possible, and inter-group variance should be as large as possible.

Total Variance = Intra-group Variance + Inter-group Variance
Clustering Techniques (Cont)

- **Nonhierarchical techniques**: Start with an arbitrary set of $k$ clusters, Move members until the intra-group variance is minimum.

- **Hierarchical Techniques**:
  - Agglomerative: Start with $n$ clusters and merge
  - Divisive: Start with one cluster and divide.

- Two popular techniques:
  - Minimum spanning tree method (agglomerative)
  - Centroid method (Divisive)
Minimum Spanning Tree-Clustering Method

1. Start with $k = n$ clusters.
2. Find the centroid of the $i^{th}$ cluster, $i=1, 2, \ldots, k$.
3. Compute the inter-cluster distance matrix.
4. Merge the the nearest clusters.
5. Repeat steps 2 through 4 until all components are part of one cluster.
Minimum Spanning Tree Example

<table>
<thead>
<tr>
<th>Program</th>
<th>CPU Time</th>
<th>Disk I/O</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>2</td>
<td>4</td>
</tr>
<tr>
<td>B</td>
<td>3</td>
<td>5</td>
</tr>
<tr>
<td>C</td>
<td>1</td>
<td>6</td>
</tr>
<tr>
<td>D</td>
<td>4</td>
<td>3</td>
</tr>
<tr>
<td>E</td>
<td>5</td>
<td>2</td>
</tr>
</tbody>
</table>

- Step 1: Consider five clusters with ith cluster consisting solely of ith program.
- Step 2: The centroids are \{2, 4\}, \{3, 5\}, \{1, 6\}, \{4, 3\}, and \{5, 2\}. 
Spanning Tree Example (Cont)

- **Step 3:** The Euclidean distance is:

<table>
<thead>
<tr>
<th>Program</th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
<th>E</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>0</td>
<td>$\sqrt{2}$</td>
<td>$\sqrt{5}$</td>
<td>$\sqrt{5}$</td>
<td>$\sqrt{13}$</td>
</tr>
<tr>
<td>B</td>
<td>0</td>
<td>$\sqrt{5}$</td>
<td>$\sqrt{5}$</td>
<td>$\sqrt{13}$</td>
<td></td>
</tr>
<tr>
<td>C</td>
<td>0</td>
<td>0</td>
<td>$\sqrt{18}$</td>
<td>$\sqrt{32}$</td>
<td></td>
</tr>
<tr>
<td>D</td>
<td>0</td>
<td>0</td>
<td>$\sqrt{2}$</td>
<td></td>
<td></td>
</tr>
<tr>
<td>E</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **Step 4:** Minimum inter-cluster distance $= \sqrt{2}$. Merge A+B, D+E.
Step 2: The centroid of cluster pair AB is 
\{(2+3) ÷ 2, (4+5) ÷ 2\}, that is, \{2.5, 4.5\}.

Similarly, the centroid of pair DE is \{4.5, 2.5\}. 

Spanning Tree Example (Cont)
Spanning Tree Example (Cont)

- Step 3: The distance matrix is:

<table>
<thead>
<tr>
<th>Program</th>
<th>AB</th>
<th>C</th>
<th>DE</th>
</tr>
</thead>
<tbody>
<tr>
<td>AB</td>
<td>0</td>
<td>$\sqrt{4.5}$</td>
<td>$\sqrt{10.25}$</td>
</tr>
<tr>
<td>C</td>
<td>0</td>
<td>0</td>
<td>$\sqrt{24.4}$</td>
</tr>
<tr>
<td>DE</td>
<td></td>
<td></td>
<td>0</td>
</tr>
</tbody>
</table>

- Step 4: Merge AB and C.
- Step 2: The centroid of cluster ABC is $\{(2+3+1) \div 3, (4+5+6) \div 3\}$, that is, $\{2, 5\}$. 
Spanning Tree Example (Cont)

- **Step 3:** The distance matrix is:

<table>
<thead>
<tr>
<th>Program</th>
<th>ABC</th>
<th>DE</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABC</td>
<td>0</td>
<td>$\sqrt{12.5}$</td>
</tr>
<tr>
<td>DE</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

- **Step 4:** Minimum distance is 12.5.
  Merge ABC and DE ⇒ Single Custer ABCDE
- Dendogram = Spanning Tree

- Purpose: Obtain clusters for any given maximum allowable intra-cluster distance.
Nearest Centroid Method

- Start with $k = 1$.
- Find the centroid and intra-cluster variance for $i^{th}$ cluster, $i = 1, 2, \ldots, k$.
- Find the cluster with the highest variance and arbitrarily divide it into two clusters.
  - Find the two components that are farthest apart, assign other components according to their distance from these points.
  - Place all components below the centroid in one cluster and all components above this hyper plane in the other.
- Adjust the points in the two new clusters until the inter-cluster distance between the two clusters is maximum.
- Set $k = k+1$. Repeat steps 2 through 4 until $k = n$. 
Cluster Interpretation

- Assign all measured components to the clusters.
- Clusters with very small populations and small total resource demands can be discarded.
  (Don't just discard a small cluster)
- Interpret clusters in functional terms, e.g., a business application, or label clusters by their resource demands, for example, CPU-bound, I/O-bound, and so forth.
- Select one or more representative components from each cluster for use as test workload.
Problems with Clustering
Problems with Clustering (Cont)

- Goal: Minimize variance.
- The results of clustering are highly variable. No rules for:
  - Selection of parameters
  - Distance measure
  - Scaling
- Labeling each cluster by functionality is difficult.
  - In one study, editing programs appeared in 23 different clusters.
- Requires many repetitions of the analysis.
Workload Characterization = Models of workloads
- Averaging, Single parameter histogram, multi-parameter histograms, …
- Principal component analysis consists of finding parameter combinations that explain the most variation
- Clustering: divide workloads in groups that can be represented by a single benchmark
Exercise 6.1

The CPU time and disk I/Os of seven programs are shown in Table below. Determine the equation for principal factors.

Table 1: Data for Principal Component Exercise

<table>
<thead>
<tr>
