Cryptography and Network Security: Overview

Raj Jain
Washington University in Saint Louis
Saint Louis, MO 63130
Jain@cse.wustl.edu

Audio/Video recordings of this lecture are available at:
http://www.cse.wustl.edu/~jain/cse571-11/
Overview

1. Computer Security Concepts
2. OSI Security Architecture
3. Security Attacks
4. Security Services
5. Security Mechanisms

Standards Organizations

- National Institute of Standards & Technology (NIST)
  http://csrc.nist.gov/

- Internet Society (ISOC):
  Internet Engineering Task Force (IETF), ietf.org
  Internet Architecture Board (IAB)

- International Telecommunication Union
  Telecommunication Standardization Sector (ITU-T)
  http://www.itu.int

- International Organization for Standardization (ISO)
  http://www.iso.org
Security Components

- **Confidentiality**: Need access control, Cryptography, Existence of data
- **Integrity**: No change, content, source, prevention mechanisms, detection mechanisms
- **Availability**: Denial of service attacks,
- Confidentiality, Integrity and Availability (CIA)
OSI Security Architecture

- ITU-T X.800 “Security Architecture for OSI”
- Defines a systematic way of defining and providing security requirements
- Provides a useful, if abstract, overview of concepts
Aspects of Security

- Aspects of information security:
  - Security attack
  - Security mechanism
  - Security service

- Note:
  - Threat – a potential for violation of security
  - Attack – an assault on system security, a deliberate attempt to evade security services
Passive Attacks

Darth reads contents of message from Bob to Alice

Bob

Internet or other comms facility

Alice
Active Attacks

Darth

Capture message from Bob to Alice; later replay message to Alice

Internet or other comms facility

Bob

Alice
Security Services (X.800)

- **Authentication** - assurance that communicating entity is the one claimed
  - have both peer-entity & data origin authentication
- **Access Control** - prevention of the unauthorized use of a resource
- **Data Confidentiality** – protection of data from unauthorized disclosure
- **Data Integrity** - assurance that data received is as sent by an authorized entity
- **Non-Repudiation** - protection against denial by one of the parties in a communication
- **Availability** – resource accessible/usable
Security Mechanism

- Feature designed to detect, prevent, or recover from a security attack
- However, one particular element underlies many of the security mechanisms in use:
  - cryptographic techniques
Security Mechanisms (X.800)

- **Specific security mechanisms:**
  - Encipherment, digital signatures, access controls, data integrity, authentication exchange, traffic padding, routing control, notarization

- **Pervasive security mechanisms:**
  - Trusted functionality, security labels, event detection, security audit trails, security recovery
## Services and Mechanisms Relationship

</tbody>
</table>
1. Algorithm for Security transformation
2. Secret key generation
3. Distributed and share secret information
4. Protocol for sharing secret information
1. Select appropriate gatekeeper functions to identify users
2. Implement security controls to ensure only authorised users access designated information or resources
Summary

- NIST, IETF, ITU-T, ISO develop standards for network security
- CIA represents the 3 key components of security
- ISO X.800 security architecture specifies security attacks, services, mechanisms
- Active attacks may modify the transmitted information.
- Security services include authentication, access control, …
Lab Homework 2

1. Read about the following tools
   a. **Wireshark**, network protocol analyzer,
      [http://www.wireshark.org/download.html](http://www.wireshark.org/download.html)
      Use ftp client to download in binary mode (do not use browser)
   b. **Advanced Port Scanner**, network port scanner,
      [http://www.scanwith.com/Advanced_Port_Scanner_download.htm](http://www.scanwith.com/Advanced_Port_Scanner_download.htm)
   c. **LAN Surveyor**, network mapping shareware with 30 day trial,

2. Use advanced port scanner to scan one to three hosts on your local net
   (e.g., CSE571XPS and CSE571XPC2 in the security lab) to find their
   open ports.

3. Use network surveyor to show the map of all hosts on your local net

4. Ping [www.google.com](http://www.google.com) to find its address. Start Wireshark. Set capture
   filter option “IP Address” to capture all traffic to/from this address. Open
   a browser window and Open [www.google.com](http://www.google.com) . Stop Wireshark. Submit
   a screen capture showing the packets seen.
