Overview

1. Why Wireless is Insecure and What can we do about it?
2. IEEE 802.11 Wireless LAN Overview
3. Legacy 802.11 Security: WEP
4. IEEE 802.11i Wireless LAN Security: WPA, WPA2

Why Wireless is Insecure?

- **Channel**: Broadcast ⇒ Eavesdropping, Jamming, Active attacks on protocols
- **Mobility**: Portable devices ⇒ Not physically secured
- **Resources**: Limited memory and processing resources ⇒ Need simpler security
- **Accessibility**: May be left unattended

Wireless Network Threats

1. **Accidental Association**: Overlapping networks ⇒ unintentionally connect to neighbors
2. **Malicious Association**: Malicious access points (Free public WiFi) can steal passwords
3. **Ad-Hoc Networks**: Two computers can exchange data
4. **Nontraditional Networks**: Bluetooth can be used to eavesdrop
5. **MAC Spoofing**: Change MAC address to match a privileged computer
6. **Man-In-The-Middle Attacks**: Using rogue access point between the user and the real access point
7. **Denial of Service (DoS)**: Keep the media busy
8. **Network Injection**: Spoof routing/management messages
Countermeasures

- Turn-off SSID broadcast
- Use Cryptic SSID names
- Reduce signal strength
- Locate APs away from boundary
- Use encryption
- Use IEEE 802.1x network access control
- Change the router’s user ID from default
- Change the router’s password from default
- MAC Filtering: Only specific MAC address connect

Mobile Device Security

Mobile → Dynamic/no boundary → Cloud
1. Lack of Physical security: Mobiles cannot be locked
2. Not all devices can be trusted
3. Untrusted networks between device and the organization
4. Wide variety of contents on mobiles than on other computers (music, video, games, …)
5. Apps from untrusted vendors
6. Data may get on unsecured device
7. Location information may be used for attack

Wi-Fi Operation

- Access Points (APs) periodically broadcast a beacon with SSID (service set ID) and security level
- Subscriber stations listen to these beacons, measure signal strength and determine which AP to join
- Subscribers can also send a “Probe” to find AP’s in the neighborhood
- AP authenticates the subscriber station using shared keys
- Subscriber stations and AP exchange encrypted packets
- Subscriber station send a “Disassociate” message and log off

IEEE 802.11 Architecture

- Station
- Access Point
- Distribution System
- Server
- IBSS
- Ad-hoc Station
- Station
- Station
- Basic Service Set
- 2nd BSS
- Ad-hoc network

Ref: http://en.wikipedia.org/wiki/Service_set_%28802.11_network%29
IEEE 802.11 Architecture (Cont)

- Basic Service Area (BSA) = Cell
- Each BSA may have several access points (APs)
- Basic Service Set (BSS) = Set of stations associated with one AP
- Distribution System (DS) - wired backbone
- Extended Service Area (ESA) = Multiple BSAs interconnected via a distribution system
- Extended Service Set (ESS) = Set of stations in an ESA
- Independent Basic Service Set (IBSS): Set of computers in ad-hoc mode. May not be connected to wired backbone.
- Ad-hoc networks coexist and interoperate with infrastructure-based networks

IEEE 802.11 Services

- Association: A STA connecting with an AP.
- Disassociation: Termination of association.
- Re-association: Transfer of association from one AP to another. Mobility within BSS, within ESS, between two ESSs.
- MSDU Delivery: Interchange of packets between STAs
- Distribution: Delivery of packets between STAs possibly via the backbone distribution system
- Integration: Interchange of packets between STAs and wired stations connected to LANs on the distribution system
- Authentication: The station is authenticated
- De-authentication
- Privacy: Encryption

Wired Equivalent Privacy (WEP)

- WEP ⇒ Privacy similar to a wired network
  ⇒ Intellectual property not exposed to casual browser
  ⇒ Not protect from hacker
- First encryption standard for wireless. Defined in 802.11b
- Provides authentication and encryption
- Shared Key Authentication
  ⇒ Single key is shared by all users and access points

WEP Details

- Each device has 4 static WEP keys
- 2-bit key ID sent w Initialization Vector (IV) in clear in each packet
- Per-Packet encryption key =24-bit IV + one of pre-shared key
- Encryption Algorithm: RC4
  - Standard: 24 + 40 = 64-bit RC4 Key
  - Enhanced: 24 + 104 = 128 bit RC4 key
- WEP allows IV to be reused
- CRC-32 = Integrity Check Value (ICV)
- Data and ICV are encrypted under per-packet encryption key

```
802.11 Header   Data   CRC
  802.11 Header   IV   Data   ICV
```
WEP Encapsulation

- WEP Keys: K1, K2, K3, K4
- CRC-32
- Data
- ICV
- Xor
- Keystream
- IV, WEP Key
- MAC hdr, IV, Pad, KID, Cipher text, CRC

WEP Decapsulation

- WEP Keys: K1, K2, K3, K4
- Xor
- IV, WEP Key
- Data, ICV
- Keystream
- CRC-32
- MAC hdr, IV, Pad, KID, Cipher text, CRC

Ron's Cipher 4 (RC4)

- Stream Cipher
  - A pseudo-random stream is generated using a given key and xor'ed with the input
- Pseudo-random stream is called One-Time pad
- Key can be 1 to 256 octet
- See the C code in the reference.

- Encryption Key K
- Pseudo-random # generator
- Random byte b
- Cipher text data byte c

WEP Authentication

- Authentication is a via Challenge response using RC4 with the shared secret key.

- Challenge (Nonce)
- Decrypted nonce OK?
- Station
- Access Point
- Response (Nonce RC4 encrypted under shared key)
WEP Review

- Four 40-bit or 104-bit Keys are manually programmed in each subscriber station and AP.
- A 24-bit IV and WEP key is used to form a 64b or 128b RC4 key.
- A keystream is generated using the RC4 key.
- A 32-bit CRC is added as “Integrity check value” (ICV) to the packet.
- Plain text and keystream is xor’ed. A 32-bit CRC is added in clear.

Problems with WEP Authentication

- Record one challenge/response.
- Both plain text and encrypted text are available to attacker.
- XOR the two to get the keystream.
- Use that keystream and IV to encrypt any subsequent challenges.

Problem with Stream Cipher

- Consider two packets with the same IV ⇒ Same keystream \( b \)
- \( c_1 \oplus b; c_2 \oplus b \Rightarrow c_1 \oplus c_2 = p_1 \oplus p_2 \)
- Two packets with same IV ⇒ XOR = Difference in plain text.
- 50% chance of using the same IV in 4823 packets.
- Recovered ICV matches ⇒ Plain text is correct.
- Possible to recover all \( 2^{24} \) keystreams in a few hours.

Problems with WEP ICV

- CRC is used as ICV.
- CRC: Message polynomial is shifted and divided by CRC polynomial, the remainder is sent as CRC.
- \( p = p_n x^n + p_{n-1} x^{n-1} + \ldots + p_0 x^0 \)
- \( \text{Remainder}(p+q, c) = \text{Remainder}(p, c) + \text{Remainder}(q, c) \)
- ICV is linear: \( \text{ICV}(p+q) = \text{ICV}(p) + \text{ICV}(q) \)
- Conclusion: XOR any CRC-32 valid plain text to encrypted packet. The modified packet will pass the ICV after decryption.
WEP Problems

- No centralized key management
- Manual key distribution ⇒ Difficult to change keys
- Single set of Keys shared by all ⇒ Frequent changes necessary
- No mutual authentication
- No user management (no use of RADIUS)
- IV value is too short. Not protected from reuse.
- Weak integrity check.
- Directly uses master key
- No protection against replay

802.11i Wireless LAN Security

- Wi-Fi Alliance Wi-Fi Protected Access (WPA)
  - Software modification to existing WEP systems
    - Key mixing function to generate per packet key
    - Sequence Number to protect against replay attacks
    - 64-bit message integrity check (MIC)
    - Uses the same RC4 encryption
  - 802.11i Robust Security Network (RSN) or WPA2
    - Requires hardware replacement
    - Counter Mode with Cipher Block Chaining Message Authentication Code Protocol (CCMP)
      - AES encryption with counter mode

802.11i Phases of Operation

IEEE 802.11i Discovery Phase

- STA
- AP
- AS
- End Station

Phase 1 - Discovery
Phase 2 - Authentication
Phase 3 - Key Management
Phase 4 - Protected Data Transfer
Phase 5 - Connection Termination

STA
Probe Request: May I join please?
Probe Response: Yes, you can.
Null Authentication Request
Null Authentication Response
Secure Association Request
Association Response with Security Parameters
Encryption, Integrity, Authentication Methods

AP

- Capability negotiation
  - Confidentiality and Integrity: WEP, TKIP, CCMP, vendor specific
  - Authentication: 802.1x, Pre-shared key, vendor specific
### 802.11i Key Hierarchy

- **Pre-shared Key:** Distributed individually out-of-band
- **AAA Key:** Secret key between supplicant and AAA server
- **Master Key:** Derived from Pre-shared or AAA key
- **Transient Key:** Intermediate quantity
- **Temporal Key = For this session**
- **EAPOL Key Confirmation Key:** For integrity of EAPOL-Key frame
- **EAPOL Key Encryption Key:** To encrypt EAPOL-key frame
- **Temporal Encryption Key:** Used to encrypt data
- **Temporal MIC Key:** Used to create Data MIC (only for TKIP)
- **Group:** STA/AP to a set of STAs (Multicast)
- **STA Key:** Direct station-to-station communication in IBSS
- **Per-Frame Encryption Key:** Unique key for each MPDU

### WPA/WPA2 Keys

- **Pre-Shared Key:** Distributed individually out-of-band
- **AAA Key:** Secret key between supplicant and AAA server
- **Master Key:** Derived from Pre-shared or AAA key
- **Transient Key:** Intermediate quantity
- **Temporal Key = For this session**
- **EAPOL Key Confirmation Key:** For integrity of EAPOL-Key frame
- **EAPOL Key Encryption Key:** To encrypt EAPOL-key frame
- **Temporal Encryption Key:** Used to encrypt data
- **Temporal MIC Key:** Used to create Data MIC (only for TKIP)
- **Pair-Wise:** STA to another STA or AP (Unicast)
- **Group:** STA/AP to a set of STAs (Multicast)
- **STA Key:** Direct station-to-station communication in IBSS
- **Per-Frame Encryption Key:** Unique key for each MPDU

### Key Management

- **Temporal Key Integrity Protocol (TKIP)**
  - S/w changes only to older WEP
  - Adds 64b Michael message integrity code (MIC) instead of 32b CRC in WEP
  - Encrypts MPDU plus MIC value using 128b RC4
- **Counter Mode-CBC MAC Protocol (CCMP)**
  - Uses cipher block chaining message authentication code (CBC-MAC) for integrity
  - Uses Counter mode AES for encryption

### 802.11i Protected Data Transfer Phase

- **Temporal Key Integrity Protocol (TKIP)**
  - S/w changes only to older WEP
  - Adds 64b Michael message integrity code (MIC) instead of 32b CRC in WEP
  - Encrypts MPDU plus MIC value using 128b RC4
- **Counter Mode-CBC MAC Protocol (CCMP)**
  - Uses cipher block chaining message authentication code (CBC-MAC) for integrity
  - Uses Counter mode AES for encryption
IEEE 802.11i Pseudo-Random Fn

- PRF is required to generate nonces and keys.
- HMAC-SHA-1 is used for all
- 4 Inputs: K=Secret Key, A= Use specific text string, B= Use specific Data, length
- Set counter to 0 and take desired number of bits from the left (if less than 160)
- If more than 160 bits needed, run the function again with the next sequence number
- Example: Pair-wise Temporal Key for CCMP
  - PTK=PRF{PMK, “Pairwise key expansion”, min(AP Addr, STA Addr)||max(AP-Addr, STA-Addr)||max(Anonce, Snonce)||max(Anonce,Snonce), 384}

Security Problems Addressed

- No MAC address spoofing: MAC address included in both Michael MIC and CCMP MAC
- No replay: Each message has a sequence number (TSC in TKIP and PN in CCMP)
- No dictionary based key recovery: All keys are computer generated binary numbers
- No keystream recovery: Each key is used only once in TKIP. No keystream in CCMP.
- No Weak Key Attack: Special byte in IV in TKIP prevents weak keys. Also, keys are not reused.
- No rouge APs: Mutual authentication optional. Some APs provide certificates.
- Not Addressed: DoS attack using disassociation or deauthentication attack. Mgmt frames are still not encrypted.

Summary

1. Wireless networks and mobile devices are subject to more attacks than wired network or static devices
2. 802.11 LANs consist of Basic Service Areas connected via a wired distribution system into an Extended Service Area
3. 802.11 originally used Wired Equivalent Privacy (WEP) which used RC4 for encryption and CRC-32 for MAC. Both were trivial to attack.
4. TKIP or WPA provides per-packet key and 64-bit MIC using RC4.
5. RSN or WPA2 provides stronger encryption and authentication using AES.

Homework 18

- WEP assumed all devices in the network share a secret key. The purpose of the authentication scenario is for the STA to prove that it possesses the secret key. As shown in the figure below, the STA sends a message to AP requesting authentication. The AP issues a challenge, which is a sequence of 128 random bytes sent as plain text. The STA encrypts the challenge with the shared key and returns it to the AP. The AP decrypts the incoming value and compares it to the challenge that it sent. If there is a match, the AP confirms that authentication has succeeded.
  a. This authentication scheme is one-sided. How can it be made mutual?
  b. What information does it provide to an attacker making it easy to attack?
  c. The encryption scheme is RC4 stream cipher. How can an attacker create a valid response for any challenge after watching just one valid authentication.
Lab 18: Wireless Cracking

- In this lab, you will use aircrack-ng and associated tools to crack your WiFi password and decrypt your encrypted data.
- Do this lab on your home network not at WUSTL.
- You will need your laptop with Kali Linux USB and a mobile phone, tablet, or another computer connected to your home network.
- You will need Internet access on Kali Linux so make sure that you have another Internet connection.
- Download a list of passwords for aircrack called darkc0de.lst from: http://www.mediafire.com/file/5tvpocv5giijo0dc/darkc0de.lst
- Add your password to the list. Note that aircrack can crack only from the list of passwords you give it.

Lab 18: Wireless Cracking (Cont)

1. Log in to kali Linux USB (live option)
   - Verify your wireless network is working fine by iwconfig
   - Use iwlist wlan scanner to scan the networks around you
2. Use airodump-ng to start monitoring your wireless interface
3. Use ifconfig and notice the changes
4. Check all the available networks around you by using airodump-ng in Kali on your wireless interface
   - Use airodump-ng with appropriate options to track your network, channel and write the result to a .cap file
5. While running airodump-ng, disconnect and reconnect your mobile phone or tablet WiFi (or forget the network on the mobile and reconnect to it)
   - When you see WPA-Handshake on airdump-ng output, then proceed to the next step. Otherwise, repeat the last step (disconnect/connect) again
6. Use aircrack-ng with the appropriate options using the list you downloaded and the .cap file you saved in the previous step
   - Submit a screenshot of the output (blackout your password)
   - Collect another .cap file with the same options but this time use your network from your mobile by accessing web pages, emails, ..., many times
7. Use airedecap-ng with options to provide your network name, your password, your BSSID and the .cap file you collected in the previous step
   - Check the decryption file and submit a screenshot of your command line
   - If it does not have any decrypted data then repeat the last two steps
- Submit all commands you used and the seven screenshots indicated above.
