The Network Layer: Data Plane

Raj Jain
Washington University in Saint Louis
Saint Louis, MO 63130
Jain@wustl.edu

Audio/Video recordings of this lecture are available on-line at:
http://www.cse.wustl.edu/~jain/cse473-21/
Overview

1. Network Layer Basics
2. What’s inside a router?
3. Forwarding Protocols: IPv4, DHCP, NAT, IPv6
4. Software Defined Networking

Note: This class lecture is based on Chapter 4 of the textbook (Kurose and Ross) and the figures provided by the authors.

Student Questions

- Why is the Upper Layer Protocol section of the datagram 8 bits long, are there that many transport protocols?
Network Layer Basics

1. Forwarding and Routing
2. Connection Oriented Networks: ATM Networks
3. Classes of Service
4. Router Components
5. Packet Queuing and Dropping
Forwarding and Routing

- **Forwarding**: Input link to output link via Address prefix lookup in a table.
- **Routing**: Making the Address lookup table
- **Longest Prefix Match**

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Next Router</th>
<th>Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>126.23.45.67/32</td>
<td>125.200.1.1</td>
<td>1</td>
</tr>
<tr>
<td>128.272.15/24</td>
<td>125.200.1.2</td>
<td>2</td>
</tr>
<tr>
<td>128.272/16</td>
<td>125.200.1.1</td>
<td>1</td>
</tr>
</tbody>
</table>

Ref: Optional Homework: R3 in the textbook
Washington University in St. Louis
http://www.cse.wustl.edu/~jain/cse473-21/

Student Questions

- Is there a limit for how long an address table can be?  
  *No. There is no limit.*

**Quiz 1**: Routing is the function of making the lookup table?  
**True**
Network Service Models

- Guaranteed Delivery: No packets lost
- Bounded delay: Maximum delay
- In-Order packet delivery: Some packets may be missing
- Guaranteed minimal throughput
- Guaranteed maximum jitter: Delay variation
- Security Services (optional in most networks)
- ATM offered most of these
- IP offers none of these ⇒ Best effort service (Security is optional)

Optional Homework: R4, R5 in the textbook
What's Inside a Router?

- **Input Ports**: receive packets, lookup address, queue
  Use **Content Addressable Memories** (CAMs) and caching
- **Switch Fabric**: Send from input port to output port
- **Output Ports**: Queuing, transmit packets

**Student Questions**
- Do this input physical link also serve as the output physical link back to wherever the input came from?

*Generally, yes. However, simplex (one-way) links are possible.*
Student Questions

- Is there an industry standard for switching or is it at the discretion of each manufacturer?

*It is at the discretion of each manufacturer.*
Where Does Queuing Occur?

- If switching fabric is slow, packets wait on the input port.
- If switching fabric is fast, packets wait for output port ⇒ Queueing (Scheduling) and drop policies
- Queueing: First Come First Served (FCFS), Weighted Fair Queueing
Ideal Buffering

- Flow Control Buffering = RTT* Transmission Rate
- Buffer = RTT* Transmission Rate/√(# of TCP flows)

Student Questions

- Can you clarify what this flow control buffering referring to? Is this the buffer for the entire link and then when you divide by sqrt(# TCP flows) that is the buffer for what? Do input ports have a separate buffer from the entire link?

Buffers are at the destination. The buffers have to be as large as the number of bits on the wire.

- The book says: "router buffers ... for buffer sizing ... the amount of buffering should be equal to the average RTT times the link capacity" Where does this fit in?

Number of bits on the wire

= Length of the link in sec × Bits/sec

= RTT Link × Capacity
Packet Dropping Policies

- **Drop-Tail**: Drop the arriving packet
- **Random Early Drop (RED)**: Drop arriving packets even before the queue is full
  - Routers measure average queue and drop incoming packet with certain probability
  - ⇒ **Active Queue Management (AQM)**
Head-of-Line Blocking

- Packet at the head of the queue is waiting
  ⇒ Other packets cannot be forwarded even if they are going to other destination

![Diagram of Head-of-Line Blocking]

- Output port contention at time t - only one red packet can be transferred
- Green packet experiences HOL blocking
Network Layer Basics: Review

1. Forwarding uses routing table to find output port for datagrams using **longest prefix match**. Routing protocols make the table.

2. IP provides only **best effort** service (KISS).

4. Datagrams may be dropped even if the queues are not full (**Random early drop**).

5. Queueing at input may result in **head of line blocking**.

Ref: Read Sections 4.1, 4.2, full, Page 305-329 of the textbook. Try R1 through R16

Washington University in St. Louis    http://www.cse.wustl.edu/~jain/cse473-21/  ©2021 Raj Jain
Overview

**Forwarding Protocols**

1. IPv4 Datagram Format
2. IP Fragmentation and Reassembly
3. IP Addressing
4. Network Address Translation (NAT)
5. Universal Plug and Play
6. Dynamic Host Control Protocol (DHCP)
7. IPv6
### IP Datagram Format

<table>
<thead>
<tr>
<th>Field</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version</td>
<td>4b</td>
</tr>
<tr>
<td>Header Length in 4B words</td>
<td>4b</td>
</tr>
<tr>
<td>Type of Service</td>
<td>8b</td>
</tr>
<tr>
<td>Total Length in Bytes</td>
<td>16b</td>
</tr>
<tr>
<td>Datagram ID</td>
<td>16b</td>
</tr>
<tr>
<td>Reserved</td>
<td>1b</td>
</tr>
<tr>
<td>Don't Fragment</td>
<td>1b</td>
</tr>
<tr>
<td>More Fragments</td>
<td>1b</td>
</tr>
<tr>
<td>Fragment Offset in 8B blocks</td>
<td>13b</td>
</tr>
<tr>
<td>Time (Hops) to Live</td>
<td>8b</td>
</tr>
<tr>
<td>Upper Layer Protocol</td>
<td>8b</td>
</tr>
</tbody>
</table>

#### Flags
- Rsvd: 1b
- Don’t Fragment: 1b
- More Fragments: 1b
- Fragment Offset: 13b
- Time (Hops): 8b
- Upper Layer Protocol: 8b

#### Header Checksum: 16b
- Source IP Address: 32b
- Destination IP Address: 32b
- Options: Variable
- Padding: Variable
- Payload: Variable

Multiple of 4B

---

**Student Questions**

- **To clarify, type of service is not used?**

  *It was not used for long time. Several proposal have recently been made to use it. So it is used now.*
IP Fragmentation Fields

- Header length: in units of 32-bit words
- Data Unit Identifier (ID)
  - Sending host puts an identification number in each datagram
- Total length: Length of user data plus header in bytes
- Fragment Offset - Position of fragment in original datagram
  - In multiples of 8 byte blocks
- More fragments flag
  - Indicates that this is not the last fragment
- Datagrams can be fragmented/refragmented at any router
- Datagrams are reassembled only at the destination host

Student Questions

- What are some examples of other Upper Protocol Layer numbers? How many are there?
- See Slide 1-44
- Does total length include the other layers?
  Higher layer headers are simply data for IP. Lower layers, it does not know.
IP Fragmentation and Reassembly

Example

- 4000 byte datagram
- Maximum Transmission Unit (MTU) = 1500 bytes

One large datagram becomes several smaller datagrams

<table>
<thead>
<tr>
<th>Offset (4000)</th>
<th>ID</th>
<th>MoreFrag</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>x</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>185</td>
<td>x</td>
<td>1</td>
<td>185</td>
</tr>
<tr>
<td>370</td>
<td>x</td>
<td>0</td>
<td>370</td>
</tr>
</tbody>
</table>

Fragment data ≥ 8 Bytes
IP Header ≤ 60 Bytes
MTU > 68 Bytes
Homework 4A: Fragmentation

[8 points] Consider sending a 2400-byte datagram into a link that has an MTU of 720 bytes. Suppose the original datagram is stamped with the identification number 422. How many fragments are generated? What are the values in the various fields in the IP datagram(s) generated related to fragmentation?
# IP Address Classes

- **Class A:**
  - Address: 0
  - Network: 7
  - Local: 24
  - Bits: 24

- **Class B:**
  - Address: 10
  - Network: 14
  - Local: 16
  - Bits: 16

- **Class C:**
  - Address: 110
  - Network: 21
  - Local: 8
  - Bits: 8

- **Class D:**
  - Address: 1110
  - Host Group (Multicast): 28
  - Bits: 28

- **Class E:**
  - Address: 11110
  - Future use

- **Local = Subnet + Host (Variable length)**

---

Student Questions

©2021 Raj Jain
All IP hosts have a 32-bit address. 128.10.0.1 = 1000 0000 0000 1010 0000 0000 0000 0001
All hosts on a network have the same network prefix
Subnetting

- All hosts on a subnetwork have the same prefix. Position of the prefix is indicated by a “subnet mask”
- Example: First 23 bits = subnet
  - Address: 10010100 10101000 00010000 11110001
  - Mask: 11111111 11111111 11111110 00000000
  - .AND. 10010100 10101000 00010000 00000000

Student Questions
IP addressing: CIDR

- CIDR: Classless InterDomain Routing
  - Subnet portion of address of arbitrary length
  - Address format: a.b.c.d/x, where x is # bits in subnet portion of address
  - All 1’s in the host part is used for subnet broadcast
  - All 0’s in the host part was meant as “subnet address” but not really used for anything. Some implementation allow it to be used as host address. Some don’t. Better to avoid it.

```
11001000  00010111 00010000  00000000
```

```
subnet part  host part
11001000  00010111 00010000  00000000
```

200.23.16.0/23
[22 points] Consider a router that interconnects 3 subnets: Subnet 1, Subnet 2, and Subnet 3. Suppose all of the interfaces in each of these three subnets are required to have the prefix 223.1.17/24. Also suppose that Subnet 1 is required to support up to 61 interfaces, Subnet 2 is to support up to 96 interfaces, and Subnet 3 is to support up to 16 interfaces. Provide three network address prefixes (of the form a.b.c.d/x) that satisfy these constraints. Use adjacent allocations. For each subnet, also list the subnet mask to be used in the hosts.
Forwarding an IP Datagram

- Delivers **datagrams** to destination network (subnet)
- Routers maintain a “routing table” of “next hops”
- Next Hop field does not appear in the datagram

Student Questions

- What is the length of the IP datagram header? Does it vary?
  
  *See Slide 4-14*

- Do the other layers' headers need to get duplicated for each fragment?

  *IP only cares about its headers. Its header gets duplicated. Other layers are part of data.*

Table at R2:

<table>
<thead>
<tr>
<th>Destination</th>
<th>Next Hop</th>
</tr>
</thead>
<tbody>
<tr>
<td>Net 1</td>
<td>Forward to R1</td>
</tr>
<tr>
<td>Net 2</td>
<td>Deliver Direct</td>
</tr>
<tr>
<td>Net 3</td>
<td>Deliver Direct</td>
</tr>
<tr>
<td>Net 4</td>
<td>Forward to R3</td>
</tr>
</tbody>
</table>
Route Aggregation

- Can combine two or more prefixes into a shorter prefix
- ISPs-R-Us has a more specific route to organization 1

<table>
<thead>
<tr>
<th>Organization 0</th>
<th>200.23.16.0/23</th>
</tr>
</thead>
<tbody>
<tr>
<td>Organization 2</td>
<td>200.23.20.0/23</td>
</tr>
<tr>
<td>Organization 7</td>
<td>200.23.30.0/23</td>
</tr>
<tr>
<td>Organization 1</td>
<td>200.23.18.0/23</td>
</tr>
</tbody>
</table>

Fly-By-Night-ISP

ISPs-R-Us

Internet

“Send me anything with addresses beginning 200.23.16.0/20”

“Send me anything with addresses beginning 199.31.0.0/16 or 200.23.18.0/23”

Student Questions
"Route Print" Command in Windows

MAC: netstat -rn

Interface List
0x1 ........................... MS TCP Loopback interface
0x2 ...00 16 eb 05 af c0 ...... Intel(R) WiFi Link 5350 - Packet Scheduler Miniport
0x3 ...00 1f 16 15 7e 41 ...... Intel(R) 82567LM Gigabit Network Connection - Packet Scheduler Miniport
0x40005 ...00 05 9a 3c 78 00 ...... Cisco Systems VPN Adapter - Packet Scheduler Miniport

Active Routes:

<td>1</td>
</tr>
</tbody>
</table>

Default Gateway: 192.168.0.1

Adr & mask = Dest
⇒ Match

Longest Prefix match is used

Metric: Lower is better

Persistent Routes:
None

Note: 127.0.0.1 = Local Host, 224.x.y.z = Multicast on local LAN

Student Questions

- Do packets sent to 127.0.0.1 ever actually leave the computer onto the network before returning or is it all internal?
  - **Internal loopback.**

- What is the difference between the interface and the gateway? What is network destination vs. gateway? How do you know which interface is specified by the given address under that field?
  - **Interface=Adapter
    Gateway=Router
    Net. Destination=Dest Adr**
Lab 4A: Routing Table

- [8 Points] Use “Route Help” in Windows (or man route in MAC) to learn the route command
- Ping www.google.com to find its address
- Make sure that you have two active interfaces preferably connected to different routers. For example, create a 2nd interface by connecting a smart phone hot spot via USB. Or by connecting to a router in our lab during TA hours
- Print route table
- Trace route to www.google.com using tracert
- Modify the routing table so that the other interface will be used.
- Note the command you used to modify the routing table
- Print the new routing table
- Trace route to the same numeric address for www.google.com as before. Submit underlined items.

Student Questions

- Don’t have a phone hotspot? Could I just use a non-washu VPN?
  Not sure if traceroute will work with VPN. Did you try and did it work?
Lab 4A Hints

- A host with two interfaces going to the same router:
- Trace route result will not change even if you change the interface.

IPv4 Route Table

<table>
<thead>
<tr>
<th>Network Destination</th>
<th>Netmask</th>
<th>Gateway</th>
<th>Interface</th>
<th>Metric</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0.0.0</td>
<td>0.0.0.0</td>
<td>192.168.0.1</td>
<td>192.168.0.152</td>
<td>55</td>
</tr>
<tr>
<td>0.0.0.0</td>
<td>0.0.0.0</td>
<td>192.168.0.1</td>
<td>192.168.0.151</td>
<td>25</td>
</tr>
</tbody>
</table>
Lab 4A Hints (Cont)

- If you have two routers, you can see the effect in trace route. One way to get two routers is to use your cell phone hot spot:

- WiFi on phone should be disabled to ensure that it does not forward the traffic to the same home router.
Another way to get two routers is to use another router. We have placed an extra router in our lab.

IPv4 Route Table

<table>
<thead>
<tr>
<th>Network Destination</th>
<th>Netmask</th>
<th>Gateway</th>
<th>Interface</th>
<th>Metric</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0.0.0</td>
<td>0.0.0.0</td>
<td>192.168.0.1</td>
<td>192.168.0.151</td>
<td>25</td>
</tr>
<tr>
<td>0.0.0.0</td>
<td>0.0.0.0</td>
<td>172.20.10.1</td>
<td>172.20.10.2</td>
<td>35</td>
</tr>
</tbody>
</table>
Lab 4A Hints (Cont)

- **WWW.google.com** may have different IP addresses on different networks and so trace route to the same numeric address.
- WUSTL VPN rejects all traffic not going to WUSTL. So it can not be used as the 2nd interface.
- The new metric assigned by the route command may not be what you specified. So always check using route print.
Lab 4A Hints (Cont)

A. Use “route help” to learn the route command
- **Windows:** route help
- **Linux:** route help
- **MAC:**
  - man netstat
  - man route

B. Ping [www.google.com](http://www.google.com) to find its address
- ping [www.google.com](http://www.google.com)

C. Print the new routing table
- **Windows:**
  - route print
- **Linux:**
  - route
- **MAC:**
  - netstat -nr

D. Modify routing tables
- **Windows:**
  - route add/delete/change
- **Linux:**
  - route add/del
- **MAC:**
  - sudo route –nv add

E. Verify using tracert
- **Windows:**
  - tracert
- **Linux:**
  - traceroute
- **MAC:**
  - traceroute

Student Questions

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse473-21/

©2021 Raj Jain
Private Addresses

- Any organization can use these inside their network
  Can’t go on the internet. [RFC 1918]
- 10.0.0.0 - 10.255.255.255 (10/8 prefix)
- 172.16.0.0 - 172.31.255.255 (172.16/12 prefix)
- 192.168.0.0 - 192.168.255.255 (192.168/16 prefix)
Network Address Translation (NAT)

- Private IP addresses 192.168.x.x
- Can be used by anyone inside their networks
- Cannot be used on the public Internet
- NAT overwrites source addresses on all outgoing packets and overwrites destination addresses on all incoming packets
- Only outgoing connections are possible

Student Questions

- Is incoming UDP traffic forwarded differently by NAT? 
  No
- Does each subnet usually have a DHCP? Does DHCP assign private or public addresses? 
  Yes, but you can use statically assigned addresses and will not need a DHCP server. DHCP can assign whatever address range you give. Most companies don't have that many public addresses. Some companies do. E.g., WUSTL.
- How do hosts get a more permanent IP address, for example a web server shouldn't be constantly changing IPs.
  You can build the address in the server itself. Or ask your DHCP server (router) to assign it a fixed address.
Universal Plug and Play

- NAT needs to be manually programmed to forward external requests
- UPnP allows hosts to request port forwarding
- Both hosts and NAT should be UPnP aware
- Host requests forwarding all port xx messages to it
- NAT returns the public address and the port #.
- Host can then announce the address and port # outside
- Outside hosts can then reach the internal host (server)
Homework 4C: NAT

[4 points] Consider a home network of 3 computers connected to the Internet via a NAT router. Suppose the ISP assigns the router the address 23.34.112.235 and that the network address of the home network is 192.168.1/29.

A. Assign addresses to all interfaces in the home network starting with the lowest possible address.
B. What is the subnet mask for the home computers?
C. Suppose each host has two ongoing TCP connections, all to port 80 at host 128.119.40.86. Provide the six corresponding entries in the NAT translation table. Both NAT and computers use source ports starting at 3000.
DHCP

- Dynamic Host Control Protocol
- Allows hosts to get an IP address automatically from a server
- Do not need to program each host manually
- Each allocation has a limited “lease” time
- Can reuse a limited number of addresses
- Hosts broadcast “Is there a DHCP Server Here?”
  Sent to 255.255.255.255
- DHCP servers respond
DHCP Example

DHCP server: 223.1.2.5

DHCP discover
src: 0.0.0.0, 68
dest.: 255.255.255.255,67
yiaddr: 0.0.0.0
transaction ID: 654

DHCP offer
src: 223.1.2.5, 67
dest: 255.255.255.255, 68
yiaddr: 223.1.2.4
transaction ID: 654
Lifetime: 3600 secs

DHCP request
src: 0.0.0.0, 68
dest: 255.255.255.255, 67
yiaddr: 223.1.2.4
transaction ID: 655
Lifetime: 3600 secs

DHCP ACK
src: 223.1.2.5, 67
dest: 255.255.255.255, 68
yiaddr: 223.1.2.4
transaction ID: 655
Lifetime: 3600 secs
[15 points] Download the Wireshark traces from http://gaia.cs.umass.edu/wireshark-labs/wireshark-traces.zip

Open dhcp-ethereal-trace-1 in Wireshark. Select View → Expand All. Answer the following questions:

1. Examine Frame 2 marked DHCP.
   A. What transport protocol and destination port # is used by DHCP?
   B. What are the source and destination IP addresses for this frame and why?
   C. What is the Type-Length-Value for the DHCP Discover option?

2. Examine Frames 4, 5, 6 to find Type-Length-Value for:
   A. DHCP Offer
   B. DHCP Request
   C. DHCP Ack
Lab 4B: DHCP (Cont)

3. Examine Frame 4:
   A. What IP address was assigned by the DHCP server?
   B. What IP address is this frame addressed to and why?
   C. What other information was provided by the DHCP server?
      1. Subnet Mask:
      2. Default Gateway:
      3. DNS1:
      4. DNS2:
      5. Domain Name:
      6. Lease Time:

4. Examine Frame 5 and find what preferred IP address was requested by the client?
IPv6

- Shortage of IPv4 addresses ⇒ Need larger addresses
- IPv6 was designed with 128-bit addresses
  \[2^{128} = 3.4 \times 10^{38}\] addresses
  ⇒ 665 \times 10^{21} addresses per sq. m of earth surface
- If assigned at the rate of 10^6/\mu s, it would take 20 years
- **Dot-Decimal:** 127.23.45.88
- **Colon-Hex:** FEDC:0000:0000:0000:3243:0000:0000:ABCD
  - Can skip leading zeros of each word
  - Can skip one sequence of zero words, e.g.,
    FEDC::3243:0000:0000:ABCD
    ::3243:0000:0000:ABCD
  - Can leave the last 32 bits in dot-decimal, e.g., ::127.23.45.88
  - Can specify a prefix by /length, e.g., 2345:BA23:0007::/50
IPv6 Header

- IPv6:

<table>
<thead>
<tr>
<th>Version (4b)</th>
<th>Traffic Class (8b)</th>
<th>Flow Label (20b)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Payload Length (16b)</td>
<td>Next Header (8b)</td>
<td>Hop Limit (8b)</td>
</tr>
<tr>
<td>Source Address (128b)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Destination Address (128b)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- IPv4:

<table>
<thead>
<tr>
<th>Version</th>
<th>IHL</th>
<th>Type of Service</th>
<th>Total Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification</td>
<td>Flags</td>
<td>Fragment Offset</td>
<td></td>
</tr>
<tr>
<td>Time to Live</td>
<td>Protocol</td>
<td>Header Checksum</td>
<td></td>
</tr>
<tr>
<td>Source Address</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Destination Address</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Options</td>
<td>Padding</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
IPv6 vs. IPv4

- 1995 vs. 1975
- IPv6 only twice the size of IPv4 header
- Only version number has same position and meaning as in IPv4
- Removed: header length, type of service, identification, flags, fragment offset, header checksum ⇒ No fragmentation
- Datagram length replaced by payload length
- Protocol type replaced by next header
- Time to live replaced by hop limit
- Added: Priority and flow label
- All fixed size fields.
- No optional fields. Replaced by extension headers.
- 8-bit hop limit = 255 hops max (Limits looping)
- Next Header = 6 (TCP), 17 (UDP)
IPv4 to IPv6 Transition

- **Dual Stack**: Each IPv6 router also implements IPv4. IPv6 is used only if source host, destination host, and all routers on the path are IPv6 aware.

- **Tunneling**: The last IPv6 router puts the entire IPv6 datagram in a new IPv4 datagram addressed to the next IPv6 router = **Encapsulation**

### Physical View

- **S**: IPv6
- **A**: IPv6
- **B**: IPv6
- **IPv4**: IPv4
- **E**: IPv6
- **F**: IPv6
- **D**: IPv6

### Logical View

- **S**: IPv6
- **B**: IPv6
- **E**: IPv6
- **F**: IPv6
- **D**: IPv6

---

**IPv4 From:B to E** | **IPv6 From:S to D** | **Data**
Forwarding Protocols: Review

1. IPv4 uses 32 bit addresses consisting of *subnet + host*
2. **Private addresses** can be reused
   ⇒ Helped solve the address shortage to a great extent
3. **DHCP** is used to automatically allocate addresses to hosts
4. IPv6 uses **128 bit addresses**. Requires dual stack or **tunneling** to coexist with IPv4.

Ref: Read Section 4.3 of the textbook. Try R17 through R29.
Generalized Forwarding and SDN

- Planes of Networking
- Data vs. Control Logic
- OpenFlow Protocol
Planes of Networking

- **Data Plane**: All activities involving as well as resulting from data packets sent by the end user, e.g.,
  - Forwarding
  - Fragmentation and reassembly
  - Replication for multicasting

- **Control Plane**: All activities that are necessary to perform data plane activities but do not involve end-user data packets
  - Making routing tables
  - Setting packet handling policies (e.g., security)
  - Base station beacons announcing availability of services

Ref: Open Data Center Alliance Usage Model: Software Defined Networking Rev 1.0,”
Planes of Networking (Cont)

- **Management Plane**: All activities related to provisioning and monitoring of the networks
  - Fault, Configuration, Accounting, Performance and Security (FCAPS).
  - Instantiate new devices and protocols (Turn devices on/off)
  - Optional ⇒ May be handled manually for small networks.

- **Services Plane**: Middlebox services to improve performance or security, e.g.,
  - Load Balancers, Proxy Service, Intrusion Detection, Firewalls, SSL Off-loaders
  - Optional ⇒ Not required for small networks
Data vs. Control Logic

- Data plane runs at line rate, e.g., 100 Gbps for 100 Gbps Ethernet ⇒ Fast Path
  ⇒ Typically implemented using special hardware, e.g., Ternary Content Addressable Memories (TCAMs)

- Some exceptional data plane activities are handled by the CPU in the switch ⇒ Slow path
  e.g., Broadcast, Unknown, and Multicast (BUM) traffic

- All control activities are generally handled by CPU
OpenFlow: Key Ideas

1. Separation of control and data planes
2. Centralization of control
3. Flow based control

Student Questions
Separation of Control and Data Plane

- Control logic is moved to a controller
- Switches only have forwarding elements
- One expensive controller with a lot of cheap switches
- OpenFlow is the protocol to send/receive forwarding rules from controller to switches
OpenFlow V1.0

On packet arrival, match the header fields with flow entries in a table, if any entry matches, perform indicated actions, and update the counters indicated in that entry.

### Header Fields

<table>
<thead>
<tr>
<th>Ingress Port</th>
<th>Ether Source</th>
<th>Ether Dest</th>
<th>VLAN ID</th>
<th>VLAN Priority</th>
<th>IP Src</th>
<th>IP Dst</th>
<th>IP Proto</th>
<th>IP ToS</th>
<th>Src L4 Port</th>
<th>Dst L4 Port</th>
</tr>
</thead>
</table>

<td>*</td>
<td>*</td>
<td>0x1</td>
<td>*</td>
<td>*</td>
<td>*</td>
<td>Controller</td>
<td>1</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **Idle timeout**: Remove entry if no packets received for this time
- **Hard timeout**: Remove entry after this time
- If both are set, the entry is removed if either one expires.

Matching

- Set Input Port
- Ether Src
- Ether Dst
- Ether Type
- Set all others to zero

**EtherType**

- **=0x8100?**
  - Y
    - Set VLAN ID
    - Set VLAN Priority
    - Use EtherType in VLAN tag for next EtherType Check
  - N
    - Not IP Fragment?
      - Y
        - IP Proto =6 or 7
      - N
        - IP Proto =1?
          - Y
            - Use ICMP Type and code for L4 Fields
          - N
            - Packet lookup using assigned header fields

- **=0x0806?**
  - Y
    - Set IP Src, IP Dst
    - IP Proto, IP ToS from within ARP
  - N
    - Set IP Src, IP Dst
    - IP Proto, IP ToS

- **=0x0800?**
  - Y
    - Not IP Fragment?
      - Y
        - IP Proto =6 or 7
      - N
        - IP Proto =1?
          - Y
            - Use ICMP Type and code for L4 Fields
          - N
            - Packet lookup using assigned header fields
  - N
    - Apply Actions

**Match Table 0?**

- Y
  - Apply Actions
- N
  - Match Table n?
    - Y
      - Apply Actions
    - N
      - Send to Controller

**Match Table n?**

- Y
  - Apply Actions
- N
  - Set Src Port, Dst Port for L4 fields

**IP Proto**

- =6 or 7
- =1?
## Counters

<table>
<thead>
<tr>
<th>Per Table</th>
<th>Per Flow</th>
<th>Per Port</th>
<th>Per Queue</th>

<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Receive CRC Errors</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Collisions</td>
<td></td>
</tr>
</tbody>
</table>
Actions

- Forward to Physical/Virtual Port $i$
- Enqueue: To a particular queue in the port $\Rightarrow$ QoS
- Drop
- Modify Field: E.g., add/remove VLAN tags, ToS bits, Change TTL
- Masking allows matching only selected fields, e.g., Dest. IP, Dest. MAC, etc.
- If header matches an entry, corresponding actions are performed and counters are updated
- If no header match, the packet is queued and the header is sent to the controller, which sends a new rule. Subsequent packets of the flow are handled by this rule.
- Secure Channel: Between controller and the switch using TLS
Actions (Cont)

- Modern switches already implement flow tables, typically using Ternary Content Addressable Memories (TCAMs)
- Controller can change the forwarding rules if a client moves ⇒ Packets for mobile clients are forwarded correctly
- Controller can send flow table entries beforehand (Proactive) or Send on demand (Reactive). OpenFlow allows both models.
1. **Data plane** consists of packets sent by the users
2. OpenFlow separates data plane from the **control plane** and centralizes the control plane
3. The **controller** makes rules for forwarding and sends to switches
4. Switches match the rules and take specified actions
Network Layer Data Plane: Summary

1. **Forwarding** consists of matching the destination address to a list of entries in a table. **Routing** consists of making that table.

2. IP is a forwarding protocol. IPv4 uses 32 bit addresses in **dot-decimal notation**. IPv6 uses 128 bit addresses in **Hex-Colon notation**.

3. **DHCP** is used to assign addresses dynamically.

4. **Private addresses** are used inside an enterprise network. **NAT** allows a single public address to be used by many internal hosts with private addresses.

5. **OpenFlow** separates data plane from control plane and centralizes the control plane.
