Low Power WAN Protocols for IoT: IEEE 802.11ah, LoRaWAN, Sigfox

Raj Jain
Washington University in Saint Louis
Saint Louis, MO 63130
Jain@cse.wustl.edu

Audio/Video recordings of this class lecture are available at:
http://www.cse.wustl.edu/~jain/cse574-18/
Overview

1. IoT Protocols on the Hype
2. Low-Power WANs
3. IEEE 802.11ah
4. LoRaWAN
5. Sigfox

Note: This is the 6th lecture in series of class lectures on IoT. Bluetooth, Bluetooth Smart, IEEE 802.15.4, ZigBee, 6LowPAN, RPL were covered in the previous lectures.
Gartner’s Hype cycle for IoT Standards and Protocols 2017

Washington University in St. Louis

IoT Protocols on the Hype

- **Li-Fi**: Light Fidelity. Optical wireless at 100+ Gbps\(^1\)
- **IEEE 802.11ax**: Successor to IEEE 802.11ac with 11 Gbps throughput and larger number of nodes\(^2\)
- **Thread**: Networking over 802.15.4 using IPv6 over 6LowPAN\(^3\)
- **LPWA**: Low Power Wide Area Network\(^4\)
  - **Lora**: Long-Range
  - **Sigfox**
  - **802.11ah**
  - **RPMA**: Random Phase Multiple Access. Proprietary LPWA by Ingenu\(^5\)

Ref: 1 [https://en.wikipedia.org/wiki/Li-Fi](https://en.wikipedia.org/wiki/Li-Fi)  
IoT Protocols on the Hype (Cont)

- Wi-SUN: Wireless Smart Ubiquitous Network. Field area network for utility industry. Used by Tokyo Electric Power
- Cellular: 5G, NB-IoT, LTE-M
- OneM2M: Consortium of eight standards organization for IoT (Machine to Machine)
- Security:
  - MatrixSSL: Open source TLS/SSL implementation for IoT devices
  - FIDO: Fast Identity Online authentication protocol
  - IEEE 802.11ai-2016: Secure and fast Link setup

Ref: 1 https://tools.ietf.org/id/draft-heile-lpwan-wisun-overview-00.html
2 https://en.wikipedia.org/wiki/OneM2M

IoT Protocols on the Hype (Cont)

- Lightweight M2M: By Open Mobile Alliance and IPSO Alliance for smart object management and interoperability

- Application Support Layer:
  - MQTT: Message Queuing Telemetry Transport
  - AMQP: Advanced Message Queuing Protocol
  - SCOTA (Software/firmware components/updates over the air)
  - CoAP: Constrained Application Protocol. Web transfer protocol for constrained (IoT) devices
  - DotDot: Network independent version of Zigbee's cluster library

Ref: 1 https://en.wikipedia.org/wiki/OMA_LWM2M
2 http://www.cse.wustl.edu/~jain/cse570-18/m_14mqtt.htm
4 https://en.wikipedia.org/wiki/Over-the-air_programming
6 https://www.zigbee.org/zigbee-for-developers/dotdot/
IoT Protocols on the Hype (Cont)

- Operating Systems:
  - TinyOS: Open source operating system for IoT\(^1\)
  - Contiki: Open source OS/networking stack for IoT\(^2\)
  - LiteOS: Huawei Real-time operating systems for IoT\(^3\)

Ref: 
3. [https://en.wikipedia.org/wiki/LiteOS](https://en.wikipedia.org/wiki/LiteOS)
Low-Power WAN Applications

- Sensors:
  - Smart Grid – meter reading
  - Agriculture monitoring
  - Industrial sensors
  - Building automation

- Machine to Machine (M2M) Communication:
  - Factory automation
  - Traffic Control
  - Medical devices
Sample LPWAN Application

Wide Area Network (WAN)

* 802.15.4g is no longer active

Neighborhood Area Network (NAN)

Home Area Network (HAN)

Wired

Gateway*

802.15.4g (PAN LR-WAN)

Distributed Automation Device

Distributed Automation Device

802.11ah AP

Gas Meter

Water Meter

Power Meter

Data Aggregator

* 802.15.4g is no longer active
IEEE 802.11ah Features

- *Aka “WiFi HaLow”* by WiFi Alliance.
- IEEE spec for Low-rate long-range IoT applications. Currently in 2nd Sponsor ballot (March 2016).
- **Spectrum**: Sub-Giga Hertz license-exempt spectrum. Not including TV white spaces (700 MHz for 802.11af).
  - 902-928 MHz (USA)
  - 863-868.6 MHz (Europe)
  - 916.5-927.5 MHz (Japan)
  - 755-787 MHz (China)
  - 917.5-923.5 MHz (Korea)
- **Sub-GHz frequency** ⇒ Longer range than 2.4 GHz, Less congested, better penetration
- Low bit rate for IoT, Short data transmissions, Power savings, Efficient MAC
- Goal: Support at least 4X **devices** per AP than legacy 802.11
IEEE 802.11ah Range

- 150 kbps to 78 Mbps per spatial stream (up to 4 streams)

Washington University in St. Louis http://www.cse.wustl.edu/~jain/cse574-18/ ©2018 Raj Jain
IEEE 802.11ah PHY

1. 802.11ac PHY **down clocked** by 10X
   - 2/4/8/16 MHz channels in place of 20/40/80/160 MHz in ac
   - 20 MHz 11ac and 2 MHz 11ah both have 64 FFT size and 48 data subcarriers + 4 pilots ⇒ 1/10th inter-carrier spacing
     ⇒ 10X longer Symbols ⇒ Allows 10X delay spread
     ⇒ All times (SIFS, ACKs) are 10x longer
   - New 1 MHz PHY with 32 FFT and 24 data subcarriers

2. **Adjacent channel bonding**: 1MHz+1MHz = 2 MHz

3. All stations have to support 1MHz and 2MHz

4. Up to **4 spatial streams** (compared to 8 in 11ac)

5. 1 MHz also allows a new MCS 10 which is MCS0 with 2x repetition ⇒ Allows 9 times longer reach than 2.4GHz

6. **Beam forming** to create sectors

IEEE 802.11ah MAC

- **Large number of devices** per Access Point (AP)
  - Hierarchical Association Identifier (AID)
  - 802.11g/n/ac allow ~2^{11} stations,
    802.11ah designed to allow ~2^{14} stations eventually

- **Relays** are used to allow connectivity outside the coverage area. Limited to 2-hops.

- **Power Savings Enhancements:**
  - Allows stations to sleep and save energy.
  - AP negotiates a Target Wake Time (TWT) for individual stations

- **Speed frame exchange** allows stations to exchange a sequence of frames for a TXOP.

Washington University in St. Louis [http://www.cse.wustl.edu/~jain/cse574-18/](http://www.cse.wustl.edu/~jain/cse574-18/)
MAC Protocol Versions

- Protocol Version 0 (PV0) is same as that for b/a/g/n/ac
- Protocol version 1 (PV1) is optimized for IoT
  - Short headers
  - Null Data packets: Only PHY, No MAC. For Acks.
  - Speed frame exchange: Multi-frame transmissions
  - Improved channel access

Washington University in St. Louis http://www.cse.wustl.edu/~jain/cse574-18/ ©2018 Raj Jain
802.11ah: Summary

1. 802.11ah runs at 900 MHz band ⇒ Longer distance
2. 802.11ah is 802.11ac down by 10x. It uses OFDM with 1/2/4/8/16 MHz channels. Longer symbols ⇒ Longer multi-path
3. MAC is more efficient by eliminating reducing header, aggregating acks, null data packets, speed frame exchanges
4. Saves energy by allowing stations and AP to sleep longer
5. Slow adoption by industry ⇒ No products by major companies
Other LPWANs

Low Power Wide Area Networks (LPWANs)

- **LoRaWAN**, [https://www.lora-alliance.org](https://www.lora-alliance.org)
- Weightless-P (High Performance), [http://www.weightless.org/](http://www.weightless.org/)
- M2M Spectrum, [http://m2mspectrum.com](http://m2mspectrum.com)

LoRaWAN

- Long Range Wide Area Network.
- Originally developed by Cyclos in France. Acquired by Semtech corporation, which formed LoRa Alliance. Now 160+ members.
- Rapid Adoption: Products already available on Amazon.

Transceiver

Arduino Radio Shield

Connectivity Kit for Arduino, Wasp mote, Raspberry Pi

Ref: https://www.lora-alliance.org/What-Is-LoRa/Technology
Washington University in St. Louis http://www.cse.wustl.edu/~jain/cse574-18/
Key Features of LoRaWAN

- **Bidirectional** communication
  - **Low Rate**: 0.3 kbps to 22 kbps in Europe, 0.9 kbps in US
- **Star of Stars Topology**: Gateways are transparent bridges. Server is the brain. Simple devices. Relays are optional.
- **Secure**: EUI128 Device Key, EUI64 Network Key, EUI64 Application Key

Ref: https://www.lora-alliance.org/What-Is-LoRa/Technology

Washington University in St. Louis http://www.cse.wustl.edu/~jain/cse574-18/ ©2018 Raj Jain
LoRa Frequency Band

- Uses ISM license-exempt band:
  - 915 MHz MHz in US. Power limit. No duty cycle limit.
  - 868 MHz in Europe. 1% and 10% duty cycle limit
  - 433 MHz in Asia
- Same techniques can be used in 2.4GHz or 5.8 GHz
- Currently suitable for public (single) deployment in an area
  - All gateways report to the same server
  - A device can talk to any gateway
  - All devices use the same frequency

Ref: [http://www.link-labs.com/what-is-lora/](http://www.link-labs.com/what-is-lora/)
Chirp Spread Spectrum

- **Chirp**: A signal with continuously increasing (or decreasing) frequency (Whale sound)
- **Chirp Spread Spectrum**: signal is frequency modulated with frequency increasing (or decreasing) from min to max (or max to min) ⇒ power is spread over the entire spectrum

Washington University in St. Louis [http://www.cse.wustl.edu/~jain/cse574-18/](http://www.cse.wustl.edu/~jain/cse574-18/)
LoRa Modulation

- Designed to achieve high sensitivity using a cheap crystal
- Allows low power transmissions over long distances
- A form of Chirp spread spectrum.
- Data is encoded using the frequency increase/decrease rate
  ⇒ Data rate and link condition determines the frequency bandwidth required
- Multiple parallel transmissions with different data rates on the same frequency
- Can receive signals **19.5 dB below** noise floor with forward error correction (FEC)
- Power level is determined adaptively based on data rate and link condition. Fast communication is used to save battery.

Ref: “LoRA Physical Layer and RF Interface,” Radio-Electronics,
Washington University in St. Louis http://www.cse.wustl.edu/~jain/cse574-18/ ©2018 Raj Jain
LoRaWAN MAC

- LoRaWAN: MAC function over LoRa PHY (Other MACs can be used over LoRA PHY)
- Server manages the network and runs MAC
  - Assigns each device is a frequency, spreading code, data rate
  - Eliminates duplicate receptions
  - Schedules acknowledgements
  - Adapts data rates
- All gateways of a network are synchronized
- Data rate is determined by distance and message duration
- Server determines the data rate using an adaptive data rate (ADR) scheme
- Competition: Sigfox, NB-IoT
LoRaWAN: Summary

1. LoRaWAN is the new MAC standardized by LoRa Alliance
2. LoRa modulation is a variation of chirp spread spectrum where the rate of frequency increase/decrease is modulated by symbol
   ⇒ Increases its resistance to noise
   ⇒ Allows multiple parallel transmissions in one frequency
3. Centralized management and media access control using a “server”
4. Devices broadcast to all gateways. The best gateway replies back.
Sigfox

- Proprietary protocol developed by Sigfox for 900 MHz ISM band
- Ultra-narrowband spectrum:
  100 Hz per user => Long symbols => resistance to noise
- Simple BPSK Modulation => 100-600 bps
- Inexpensive end-point radio, sophisticated base station
- Receiver sensitivity on the end-point is less => downlink capacity is less
- Network in the process of being deployed in 60 countries
- 6 million objects by end of 2018
- Covers 24 of top 25 metropolitan areas in US

Washington University in St. Louis http://www.cse.wustl.edu/~jain/cse574-18/
LoRa vs. Sigfox

- Common:
  - Both have proprietary technology
  - Both use 900/868 MHz ISM band
  - Both use star network architecture
  - Multiple base stations/gateways listen to the packets from IoT devices

### LoRa vs. Sigfox (Cont)

</tbody>
</table>
Summary

1. IoT protocol space is very crowded. Many protocols are being hyped.
2. Low Power WANs are used for Utility and citywide applications.
3. IEEE 802.11ah was standardized but seeing limited use.
4. LoRaWAN uses LoRa modulation and has many products.
5. Sigfox is betting on Network as a service.
Lab 1

A. Download InSSIDer v3.1.2.1 from:
   - [http://www.techspot.com/downloads/5936-inssider.html](http://www.techspot.com/downloads/5936-inssider.html) or
   - [http://www.filecroco.com/download-inssider](http://www.filecroco.com/download-inssider)
   - Measure the signal levels of various WiFi networks
   - Submit a screen capture

B. Download Wireshark from:
   - [https://www.wireshark.org/#download](https://www.wireshark.org/#download)
   - Run a trace packets on your wireless network
   - Submit a screen capture
